## 1. Introduction

The participation in proficiency testing schemes is an essential element of the quality-management-system of every laboratory testing food and feed, cosmetics and food contact materials. The implementation of proficiency tests enables the participating laboratories to prove their own analytical competence under realistic conditions. At the same time they receive valuable data regarding the verification and/or validation of the particular testing method [1, 5].

The purpose of DLA is to offer proficiency tests for selected parameters in concentrations with practical relevance.

Realisation and evaluation of the present proficiency test follows the technical requirements of DIN EN ISO/IEC 17043 (2010) and DIN ISO 13528:2009 / ISO 13528:2015 [2, 3].

## 2. Realisation

### 2.1 Test material

The test material is a mixture of common in commerce food supplements with free amino acids from EU suppliers with a protein equivalent content of > 20%. Further additives are L-glutamic acid and maltodextrin. The capsule shells of the food supplements were removed, all raw materials sieved (mesh 600 µm), mixed and homogenized.

Afterwards the samples were portioned to approximately 10 g into metallised PET film bags and chronologically numbered.

The composition (list of ingredients) and the amounts of amino acids as calculated from the manufacturers specifications are given in table 1 and table 2 respectively.

Table 1: Composition of DLA-Samples

Amino Acid Capsule Powder
<p><u>Ingredients</u> (1. Food Supplement, without capsule shell):            Bulking agent Dicalcium phosphate, L-Leucine, L-Lysine, L-Cysteine, L-Valine, L-Isoleucine, L-Arginine, L-Tyrosine, L-Histidine, L-Threonine, L-Phenylalanine, L-Tryptophan, L-Methionine, Release agents Magnesium salts of fatty acids and Silica, Dye Titanium dioxide.</p> <p><u>Ingredients</u> (2. Food Supplement, without capsule shell):            L-Lysine HCl, L-Leucine, L-Aspartic acid, L-Isoleucine, L-Tryptophan, Bulking agent: Rice flour, L-Proline, L-Serine, L-Alanine, L-Threonine, L-Valine, L-Phenylalanine, L-Methionine, Glycine, L-Histidine.</p> <p><u>Further Ingredient:</u>            L-Glutaminic acid, maltodextrin</p>

**Note:** The metrological traceability of temperature, mass and volume during production of the PT samples is ensured by DAkkS calibrated reference materials.

**Table 2:** Calculated amounts of PT parameters according to the manufacturers specifications

Parameter	Content per 100 g	Parameter	Content per 100 g
L-Alanine	1,7 g	L-Lysine	5,0 g
L-Arginine	1,5 g	L-Methionine	1,1 g
L-Aspartic acid	3,4 g	L-Phenylalanine	1,8 g
L-Cysteine	1,5 g	L-Proline	2,1 g
L-Glutamic acid	1,5 g	L-Serine	1,7 g
Glycine	0,68 g	L-Threonine	2,6 g
L-Histidine	1,8 g	L-Tryptophan	2,7 g
L-Isoleucine	3,8 g	L-Tyrosine	1,2 g
L-Leucine	6,6 g	L-Valine	3,0 g

### 2.1.1 Homogeneity

The **mixture homogeneity before bottling** was examined 8-fold by **micro-tracer analysis**. It is a standardized method that is part of the international GMP certification system for feed [14]. Before mixing dye coated iron particles of  $\mu\text{m}$  size are added to the sample and the number of particles is determined after homogenization in taken aliquots. The evaluation of the mixture homogeneity is based on the Poisson distribution using the chi-square test. A probability of  $\geq 5\%$  is equivalent to a good homogeneous mixture and of  $\geq 25\%$  to an excellent mixture [14, 15].

The microtracer analysis of the present PT sample showed a probability of 90%. Additionally particle number results were converted into concentrations, statistically evaluated according to normal distribution and compared to the standard deviation according to Horwitz. For the assessment HorRat values between 0,3 and 1,3 are to be accepted under repeat conditions (measurements within the laboratory) [16, 17]. This gave a HorRat value of 0,64. The results of microtracer analysis are given in the documentation.

The calculation of the **repeatability standard deviations  $S_r$  of the participants** was also used as an indicator of homogeneity. For all parameters they are in the range of  $< 10\%$  (from 2,8% to 9,8%) with the exception of L-alanine and L-serine (s. Tab. 3). Thus they were similar to the repeatability standard deviations of the corresponding official methods (e.g. ASU methods, s. 3.6.2) (see Tab. 4) [18]. The repeatability standard deviations of the participants' results are given in the documentation in the statistic data (see 4.1 and 4.19).

**Table 3:** Repeatability standard deviation  $S_r$  of double determinations of the participants (coefficient of variation  $CV_r$  in %)

Parameter	CV <sub>r</sub>	Parameter	CV <sub>r</sub>
L-Alanine	16,7 %	L-Lysine	5,3 %
L-Arginine	2,8 %	L-Methionine	3,9 %
L-Aspartic acid	5,3 %	L-Phenylalanine	3,0 %
L-Cysteine	-	L-Proline	3,8 %
L-Glutamic acid	8,1 %	L-Serine	11,5 %
Glycine	13,7 %	L-Threonine	2,9 %
L-Histidine	9,8 %	L-Tryptophan	3,6 %
L-Isoleucine	3,6 %	L-Tyrosine	3,6 %
L-Leucine	3,2 %	L-Valine	4,4 %

Furthermore, the homogeneity was characterized by the **trend line function of participants' results for chronological bottled single samples**. The maximum deviations from the mean value of the trend line were in the range of 8,8% to 13,4% of the target standard deviation  $\sigma_{opt}$  or  $\sigma_{opt}'$  (s. 5.2 Homogeneity) for L-Arginine, L-Phenylalanine and L-Tyrosine and thus can be regarded as low.

In case the criterion for sufficient homogeneity of the test items is not fulfilled the impact on the target standard deviation will be verified. If necessary the evaluation of results will be done considering the standard uncertainty of the assigned value by z'-scores (s. 3.8 and 3.11) [3].

### 2.1.2 Stability

The experience with various DLA reference materials showed good storage stability with respect to the durability of the sample (spoilage) and the content of the PT parameters for comparable food matrices and water activity ( $a_w$  value <0,5). The stability of the sample material is therefore given during the investigation period under consideration of given storage conditions.

Furthermore, **participants' results** were compared with the corresponding **date of analysis** to characterize the stability of the PT-material during the whole time of analysis of the present PT (40 days) by using the trendline-functions.

The maximum deviations from the mean value of the trend line for L-Phenylalanine and L-Tyrosine were at 12% and 2,4% of the target standard deviation  $\sigma_{opt}$  or  $\sigma_{opt}'$  (see documentation section 5.3 Stability) and thus can be regarded as low. For L-Arginine the maximum deviation from the trend line was 58%, which can be due to the higher reproducibility standard deviation of the participants' results ( $CV_r$  14,8%).

## 2.2 Sample shipment and information to the test

Two portions of test material were sent to every participating laboratory in the 38<sup>th</sup> week of 2017. The testing method was optional. The tests should be finished at 3<sup>rd</sup> November 2017 the latest.

With the cover letter along with the sample shipment the following information was given to participants:

*The two portions contain identical samples of a food supplement with the parameters of free amino acids in the matrix of capsule powder. The protein equivalent content is > 20%. The analysis method is optional.*

**Please note the attached information on the proficiency test.**

(see documentation, section 5.5 Information on the PT)

## 2.3 Submission of results

The participants submitted their results in standard forms, which have been handed out with the samples (by email).

The finally calculated concentrations of the parameter as average of duplicate determinations of both numbered samples were used for the statistical evaluation. For the calculation of the repeatability- and reproducibility standard deviation the single values of the double determination were used.

Queried and documented were single results, recovery and the used testing methods. In case participants submitted several results for the same parameter obtained by different methods these results were evaluated with the same evaluation number with a letter as a suffix and indication of the related method.

All 17 participants submitted their results in time.

### 3. Evaluation

#### 3.1 Consensus value from participants (assigned value)

The robust mean of the submitted results was used as assigned value ( $X_{pt}$ ) ("consensus value from participants") providing a normal distribution. The calculation was done according to algorithm A as described in annex C of ISO 13528 [3].

The condition is that the majority of the participants' results show a normal distribution or are distributed unimodal and symmetrically. To this end, an examination of the distribution is carried out, inter alia, using the kernel density estimate [3, 12].

In case there are indications for sources of higher variability such as a bimodal distribution of results, a cause analysis is performed. Frequently different analytical methods may cause an anomaly in results' distribution. If this is the case, separate evaluations with own assigned values ( $X_{pti}$ ) are made whenever possible.

The statistical evaluation is carried out for all the parameters for a minimum of 7 values are present.

The actual measurement results will be drafted. Individual results, which are outside the specified measurement range of the participating laboratory (for example with the result  $> 25 \text{ mg/kg}$  or  $< 2,5 \text{ mg/kg}$ ) or the indicating "0" will not be considered for the statistic evaluation [3].

#### 3.2 Robust standard deviation

For comparison to the target standard deviation  $\sigma_{pt}$  (standard deviation for proficiency assessment) a robust standard deviation ( $S^*$ ) was calculated. The calculation was done according to algorithm A as described in annex C of ISO 13528 [3].

#### 3.3 Repeatability standard deviation

The repeatability standard deviation  $S_r$  is based on the laboratory's standard deviation of (outlier free) individual participant results, each under repeatability conditions, that means analyses was performed on the same sample by the same operator using the same equipment in the same laboratory within a short time. It characterizes the mean deviation of the results within the laboratories [3] and is used by DLA as an indication of the homogeneity of the sample material.

In case single results from participants are available the calculation of the repeatability standard deviation  $S_r$ , also known as standard deviation within laboratories  $S_w$ , is performed by: [3, 4].

The relative repeatability standard deviation as a percentage of the mean value is indicated as coefficient of variation  $CV_r$  in the table of statistical characteristics in the results section in case single results from participants are available.

### 3.4 Reproducibility standard deviation

The reproducibility standard deviation  $S_R$  represents a inter-laboratory estimate of the standard deviation for the determination of each parameter on the bases of (outlier free) individual participant results. It takes into account both the repeatability standard deviation  $S_r$  and the within-laboratory standard deviation  $S_s$ . Reproducibility standard deviations of PT's may differ from reproducibility standard deviations of ring trials, because the participating laboratories of a PT generally use different internal conditions and methods for determining the measured values.

In the present evaluation, the specification of the reproducibility standard deviation, therefore, does not refer to a specific method, but characterizes approximately the comparability of results between the laboratories, assumed the effect of homogeneity and stability of the sample are negligible.

In case single results from participants are available the calculation of the reproducibility standard deviation  $S_R$  is performed by: [3, 4].

The relative reproducibility standard deviation  $VK_R$  in percent of the mean is given as variation coefficient in the statistical data of participant for each parameter. The significance of  $VK_R$  is further explained in section 3.9.

### 3.5 Exclusion of results and outliers

Before statistical evaluation obvious blunders, such as those with incorrect units, decimal point errors, and results for a another proficiency test item can be removed from the data set [2]. Even if a result clearly deviates from the robust mean (e.g. factor >10) and has an influence on the robust statistics, a result can be excluded from statistical evaluation [3].

All results should be given at least with 2 significant digits. Specifying 3 significant digits is usually sufficient.

Results obtained by different analytical methods causing an increased variability and/or a bi- or multimodal distribution of results, are treated separately or could be excluded in case of too few numbers of results. For this results are checked by kernel density estimation [3, 12].

Results are identified as outliers by the use of robust statistics. If a value deviates from the robust mean by more than 3 times the robust standard deviation, it is classified as an outlier [3]. Detected outliers are stated for information only, when z-score are  $< -2$  or  $> 2$ . Due to the use of robust statistics outliers are not excluded, provided that no other reasons are present [3].

### 3.6 Target standard deviation (for proficiency assessment)

The target standard deviation of the assigned value  $\sigma_{pt}$  (= standard deviation for proficiency assessment) can be determined according to the following methods.

If an acceptable quotient  $S^*/\sigma_{pt}$  is present, the target standard deviation of the general model by Horwitz is preferably used for the proficiency assessment. It is usually suitable for evaluation of interlaboratory studies, where different methods are applied by the participants. On the other hand the target standard deviation from the evaluation of precision data of an precision experiment is derived from collaborative studies with specified analytical methods.

In cases where both above-mentioned models are not suitable, the target standard deviation is determined based on values by perception, see under 3.6.3.

For information, the z-scores of both models are given in the evaluation, if available.

*In the present PT for valuation of all following parameters the target standard deviation according to the general model of Horwitz was applied (see 3.6.1):*

#### Alanine and Arginine.

*For the valuation of the following parameters the target standard deviation from precision experiments (s. 3.6.2) (German official ASU S64 method: 18) was applied:*

Aspartic acid, Glutamic acid, Glycine, Histidine, Isoleucine, Leucine, Lysine, Phenylalanine, Proline, Serine, Threonine, Tryptophan, Tyrosine and Valine.

*Additionally for Alanine, Aspartic acid, Glycine, Isoleucine, Serine and Valine the standard uncertainty was considered by evaluation using z'-scores (see 3.6.8).*

*Due to the low number of < 7 the results of Cysteine and Cystin were not evaluated by means of z-scores.*

### 3.6.1 General model (Horwitz)

Based on statistical characteristics obtained in numerous PTs for different parameters and methods Horwitz has derived a general model for estimating the reproducibility standard deviation  $\sigma_R$  [6]. Later the model was modified by Thompson for certain concentration ranges [10]. The reproducibility standard deviation  $\sigma_R$  can be applied as the relative target standard deviation  $\sigma_{pt}$  in % of the assigned values and calculated according to the following equations [3]. For this the assigned value  $X_{pt}$  is used for the concentration  $c$ .

<b>Equations</b>	<b>Range of concentrations</b>	<b>corresponds to</b>
$\sigma_R = 0,22c$	$c < 1,2 \times 10^{-7}$	< 120 µg/kg
$\sigma_R = 0,02c^{0,8495}$	$1,2 \times 10^{-7} \leq c \leq 0,138$	≥ 120 µg/kg
$\sigma_R = 0,01c^{0,5}$	$c > 0,138$	> 13,8 g/100g

with  $c$  = mass content of analyte (as relative size, e.g. 1 mg/kg = 1 ppm =  $10^{-6}$  kg/kg)

### 3.6.2 Precision experiment

Using the reproducibility standard deviation  $\sigma_R$  and the repeatability standard deviation  $\sigma_r$  of a precision experiment (collaborative trial or proficiency test) the target standard deviation  $\sigma_{pt}$  can be derived considering the number of replicate measurements  $m$  of participants in the present PT [3]:

$$\sigma_{pt} = \sqrt{\sigma_R^2 - \sigma_r^2 (m-1/m)}$$

The relative repeatability standard deviations ( $RSD_r$ ) and relative reproducibility standard deviation ( $RSD_R$ ) given in Table 4 were determined in ring tests using the indicated methods.

The resulting target standard deviations  $\sigma_{pt}$ , which were identified there, were used to evaluate the results and to provide additional information for the statistical data.

**Table 4:** Relative repeatability standard deviations ( $RSD_r$ ) and relative reproducibility standard deviations ( $RSD_R$ ) according to selected evaluations of tests for precision and the resulting target standard deviation  $\sigma_{pt}$  [18]

Parameter	Matrix (Amino acid mixture)	Mean [mg/kg]	RSD <sub>r</sub>	RSD <sub>R</sub>	$\sigma_{pt}$	Method / Literature
L-Alanine	Dietetic food	3,09	2,75%	4,37%	3,91% <sup>1</sup>	ASU 49.07-1

L-Valine	Dietetic food	5,20	2,60%	5,20%	4,86% <sup>1</sup>	ASU 49.07-1

<sup>1</sup> used in evaluation or given for information (s. chapter 4)

The given values from ASU 49.07-1 are mean values of samples I and II (exceptions: Methionine sample I, Phenylalanine sample II only)

### *3.6.3 Value by perception*

The target standard deviation for proficiency assessment can be set at a value that corresponds to the level of performance that the coordinator would wish laboratories to be able to achieve [3].

For the present evaluation the target standard deviation according to 3.6.1 and 3.6.2 were regarded suitable.

Table 5 shows selected statistic data of participants results of present PT compared to PT results of previous years.

## 3.7 z-Score

To assess the results of the participants the z-score is used. It indicates about which multiple of the target standard deviation ( $\sigma_{pt}$ ) the result ( $x_i$ ) of the participant is deviating from the assigned value ( $x_{pt}$ ) [3].

Participants' z-scores are derived from:

$$z_i = \frac{(x_i - x_{pt})}{\sigma_{pt}}$$

The requirements for the analytical performance are generally considered as fulfilled if

$$-2 \leq z \leq 2 .$$

The valid z-Score for each parameter is indicated as z-Score ( $\sigma_{pt}$ ). The value indicated as z-Score (Info) only obtains a informative character. The both z-Scores were calculated with the different target standard deviations in accordance with 3.6.

### 3.7.1 Warning and action signals

In accordance with the norm ISO 13528 it is recommended that a result that gives rise to a z-score above 3,0 or below -3,0, shall be considered to give an "action signal" [3]. Likewise, a z-score above 2,0 or below -2,0 shall be considered to give a "warning signal". A single "action signal", or "warning signal" in two successive PT-rounds, shall be taken as evidence that an anomaly has occurred which requires investigation. For example a fault isolation or a root cause analysis through the examination of transmission error or an error in the calculation, in the trueness and precision must be performed and if necessary appropriate corrective measures should be applied [3].

In the figures of z-scores DLA gives the limits of warning and action signals as yellow and red lines respectively. According to ISO 13528 the signals are valid only in case of a number of  $\geq 10$  results [3].

**Table 5:** Characteristics of the present PT (on dark grey) in comparison to previous PTs since 2015 (SD = standard deviation, CV = coefficient of variation)

Parameter	Matrix (Powder)	rob. Mean [g/100g]	rob. SD (S*) [g/100g]	rel. SD (VK <sub>s*</sub> ) [%]	Quotient S*/σ <sub>opt</sub>	DLA Report

<sup>1</sup> with target standard deviation σ<sub>opt</sub>'

\*\* no statistical evaluation (&lt; 7 results)

### 3.8 z'-Score

The z'-score can be used for the valuation of the results of the participants, in cases the standard uncertainty has to be considered (s. 3.8). The z'-score represents the relation of the deviation of the result ( $x$ ) of the participant from the respective consensus value ( $X$ ) to the square root of quadrat sum of the target standard deviation ( $\sigma_{pt}$ ) and the standard uncertainty ( $U_{x_{pt}}$ ) [3].

The calculation is performed by:

$$z'_i = \frac{x_i - x_{pt}}{\sqrt{\sigma_{pt}^2 + u_{(x_{pt})}^2}}$$

If carried out an evaluation of the results by means of z 'score, we have defined below the expression in the denominator as a target standard deviation  $\sigma_{pt}'$ .

The requirements for the analytical performance are generally considered as fulfilled if

$$-2 \leq z' \leq 2 .$$

For warning and action signals see 3.7.1.

### 3.9 Reproducibility coefficient of variation (CV)

The variation coefficient (CV) of the reproducibility (= relative reproducibility standard deviation) is calculated from the standard deviation and the mean as follows [4, 13]:

$$CV_R = \frac{s_R * 100}{X}$$

In contrast to the standard deviation as a measure of the absolute variability the CV gives the relative variability within a data region. While a low CV, e.g. <5-10% can be taken as evidence for a homogeneous set of results, a CV of more than 50% indicates a "strong inhomogeneity of statistical mass", so that the suitability for certain applications such as the assessment of exceeded maximum levels or the performance evaluation of the participating laboratories possibly can not be done [3].

3.10 Quotient  $S^*/\sigma_{opt}$ 

Following the HorRat-value the results of a proficiency-test (PT) can be considered convincing, if the quotient of robust standard deviation  $S^*$  and target standard deviation  $\sigma_{opt}$  does not exceed the value of 2.

A value  $> 2$  means an insufficient precision, i.e. the analytical method is too variable, or the variation between the test participants is higher than estimated. Thus the comparability of the results is not given [3].

3.11 Standard uncertainty of the assigned value

Every assigned value has a standard uncertainty that depends on the analytical method, differences between the analytical methods used, the test material, the number of participating laboratories (P) and on other factors. The standard uncertainty ( $U_{(X_{pt})}$ ) for this PT is calculated as follows [3]:

$$u_{(x_{pt})} = 1,25 \times \frac{s^*}{\sqrt{p}}$$

If  $U_{(X_{pt})} \leq 0,3 \sigma_{opt}$  the standard uncertainty of the assigned value needs not to be included in the interpretation of the results of the PT [3]. Values exceeding 0,3 imply, that the target standard deviation could be too low with respect to the standard uncertainty of the assigned value.

The Quotient  $U_{(X_{pt})}/\sigma_{opt}$  is reported in the characteristics of the test.

#### 4. Results

##### Comments to the distribution of the results:

The kernel density plots showed for all parameters nearly a normal distribution of results (figures see documentation 5.4). Partly slight shoulders and separate smaller peaks can be seen, which are due to individual values and outliers.

In the case of isoleucine and leucine a distribution of results with two peaks can be seen. However, the information provided by the participants on the methods gave no obvious indications of such an array of results.

When using the robust standard deviation as an estimator  $h$ , the distributions are converted into single peak distributions, so that an statistical evaluation has been carried out.

##### Comments to the statistic data:

For cysteine/cystine there were < 7 plausible results, therefore no statistical evaluation could be done.

The target standard deviation was calculated for all other elements according to the model of Horwitz or according to the data of a precision experiment (ASU §64 method). The evaluation according to Horwitz was preferably used as long as the quotients  $S^*/\sigma_{opt}$  were in the range of ≤ 2,0. In all other cases, the standard deviation calculated from ASU §64 precision data was used. For tyrosine the target standard deviation was calculated according to ASU § 64, because the Horwitz evaluation was considered too strict for these results.

For all parameters the distribution of results showed a normal variability. The quotients  $S^*/\sigma_{opt}$  were all in the range of 0,37 to 2,0 (see table 5).

The robust standard deviation as well as the repeatability and reproducibility standard deviations were in the range of established values for the applied methods (see 3.6.2).

The comparability of results is given.

The quotient  $U(X_{pt})/\sigma_{opt}$  or  $U(X_{pt})/\sigma_{opt}'$  was < 0,3 for lysine and tryptophan. For all other parameters it was slightly increased in the range of 0,38 to 0,61. This was considered acceptable because of the other characteristics.

71% to 93% of results were in the target range.

The robust means of the participant results ranged from 80% to 120% of the amino acid content according to the manufacturer's specification (see Table 2).

All following tables are anonymized. With the delivering of the evaluation report the participants are informed about their individual evaluation number.

In the first table the characteristics are listed:

<b>Statistic Data</b>
<i>Number of results</i>
<i>Number of outliers</i>
Mean
Median
Robust mean ( $X_{pt}$ )
Robust standard deviation ( $S^*$ )
<i>Number with m replicate measurements</i>
Repeatability standard deviation ( $S_r$ )
Coefficient of Variation ( $CV_r$ ) in %
Reproducibility standard deviation ( $S_R$ )
Coefficient of Variation ( $CV_R$ ) in %
<i>Target range:</i>
Target standard deviation $\sigma_{pt}$ or $\sigma_{pt}'$
Target standard deviation for information
lower limit of target range $(X_{pt} - 2\sigma_{pt})$ or $(X_{pt} - 2\sigma_{pt}')$ *
upper limit of target range $(X_{pt} + 2\sigma_{pt})$ or $(X_{pt} + 2\sigma_{pt}')$ *
Variation coefficient $V_k$ in %
Quotient $S^*/\sigma_{pt}$ or $S^*/\sigma_{pt}'$
Standard uncertainty $U(X_{pt})$
Quotient $U(X_{pt})/\sigma_{pt}$ or $U(X_{pt})/\sigma_{pt}'$
<i>Number of results in the target range</i>
<i>Percent in the target range</i>

\* Target range is calculated with z-score or z'-score

5.1.2 Analytical Methods

Parameter	Teilnehmer	Methodenangabe, wie in Prüfbericht / Norm / Literatur	Hinweise zu Probenvorbereitung und -aufarbeitung	Hinweise zur Messmethode	Kalibrierung und Referenzmaterial	Wiederfindung mit gleicher Matrix	Methode akk. ISO/IEC 17025	Sonstige Hinweise
Analyte	Participant	Method description, like in a analysis report / norm / literature	Notes to sample preparation	Notes to analytical method	Calibration and reference material	Recovery with same matrix	Method accr. ISO/IEC 17025	Further Remarks
L-Alanin(e)	1	Waters AccQTag Ultra Derivitization Method			External Standard Calibration	No	No	
	2						No	
	3	-	water extraction	derivatization, HPLC-DAD/ HPLC-FLD/ HPLC-MS-MS	-	no	yes	-
	4	SOP M 3123	Extraction and dilution	LCMS/MS with ISTD	div. reference materials / control chart material	no	yes	
	5	Determination of free amino acids by amino acid analyser (in-house method AS 02).	ground by mortar	following Ph. Eur. 2.2.56, Method 1, post column derivatisation with ninhydrin	amino acid mix solution 79248 (Sigma-Aldrich), single substances		yes	
	6	HPAEC-IPAD			external Standard, AAS 18 Sigma and single substances		yes	
	7		sample weight: 125 mg; acidic extraction with HCl 0.01 M, incl. Carrez precipitation, filtration and ACCQ Tag Derivatization Kit from Waters	UPLC with UV PDA Detection	1 Point calibration with Waters Std+IS (Norvalin), Tau, Trp, B-Ala and Orn.	yes	no	
	8							
	9	Waters - ACCQ.TAG Chemistry Package – Instruction Manual, WAT 052 874 TP, rev. 0 April, 1993			Thermo Scientific Amino Acids Standard H	no	yes	
	10						yes	By IC
	11	Determination of free amino acids by HPLC with post column derivatisation	aquaous extract after protein precipitation with 5-sulfosalicylic acid solution	ion exchange chromatographie with post column derivatisation (ninhydrin)	Externer Standard, Einpunkt-Kalibrierung, Teewurst		yes	
	12	Determination of free amino acids in foods by amino acid analyser with ninhydrin according to ASU §64 LFGB L 49.07-2	Extraction with 0,1 M HCl	post column derivatisation with ninhydrin	internal reference material; internal standard multi-point calibration	yes	yes	
	13	ASU §64 LFGB L49.07-2/ mod.	sample wheigt 0,5g	amino acid analyser	calibration with internal standard		yes	
	14	Determination of free amino acids by amino acid analyser (P 20247 02x)	-	-	interner Standard	-	yes	-
	15	EZ:faast-Kit Phenomenex, LC-MS/MS	acidic extraction	LC-MS/MS	multi-point calibration, internal calibration, in-house LST	no	yes	
	16	HPLC/FLD after derivatisation	derivatisation with AQC		Ext. calibr. with internal standard	no	yes	
	17	free amino acids (according to regulation (EC) 152/2009)	0,1 mol/L HCl, at 40°C in ultra sonic bath	approx. 0,2 g sample wheigt	internal Std., 1-Point calibration, food supplement		yes	

Parameter	Teilnehmer	Methodenangabe, wie in Prüfbericht / Norm / Literatur	Hinweise zu Probenvorbereitung und -aufarbeitung	Hinweise zur Messmethode	Kalibrierung und Referenzmaterial	Wiederfindung mit gleicher Matrix	Methode akkr. ISO/IEC 17025	Sonstige Hinweise

## 5.2 Homogeneity

### 5.2.1 Mixture homogeneity before bottling

#### **Microtracer Homogeneity Test**

**DLA 47-2017**

Weight whole sample	1,06	kg
Microtracer	FSS-rot lake	
Particle size	75 – 300	µm
Weight per particle	2,0	µg
Addition of tracer	42,0	mg/kg

#### **Result of analysis**

Sample	Weight [g]	Particle number	Particles [mg/kg]
1	5,06	131	51,8
2	4,99	117	46,9
3	5,02	125	49,8
4	5,06	121	47,8
5	5,06	118	46,6
6	5,04	116	46,0
7	4,96	127	51,2
8	4,99	134	53,7

#### **Poisson distribution**

Number of samples	8
Degree of freedom	7
Mean	123,6
Standard deviation	7,05
$\chi^2$ (CHI-Quadrat)	2,81
<b>Probability</b>	<b>90</b>
Recovery rate	117

#### **Normal distribution**

Number of samples	8
Mean	49,2
Standard deviation	2,81
rel. Standard deviaton	5,70
Horwitz standard deviation	8,90
<b>HorRat-value</b>	<b>0,64</b>
Recovery rate	117

**5.2.2 Comparison of sample numbers / test results and trend line**

By comparison of the increasing sample numbers and the measurement results of participants, the homogeneity of the chronological bottled PT item can be characterized with the help of the trend line function:

<b>L-Arginine</b>	
Target standard deviation $\sigma_{opt}$	0,193 g/100g
Sample numbers	3 – 89
Total numbers of samples	28
Slope	0,00124
Trend line range	1,397 – 1,432 g/100g
Deviation trend line	1,415 ± 0,0174 g/100g
<b>Percent of opt</b>	9,0 %

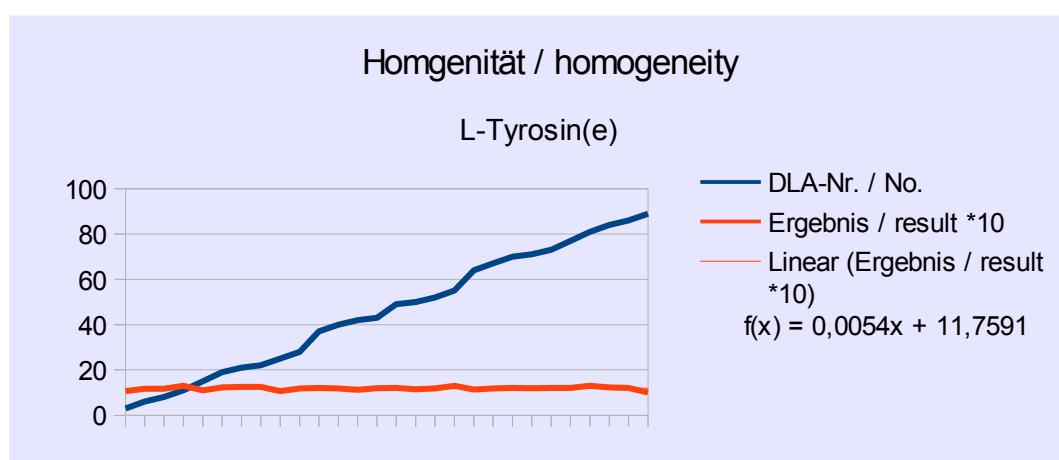

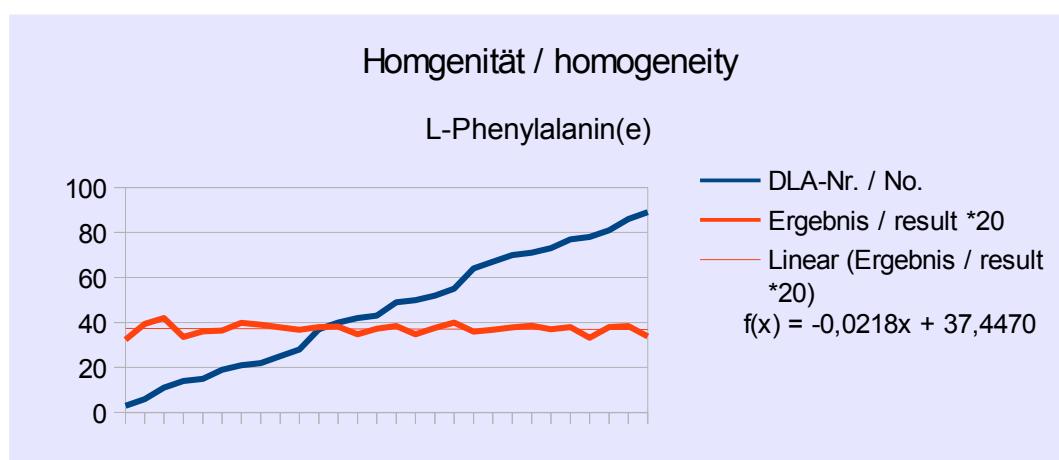

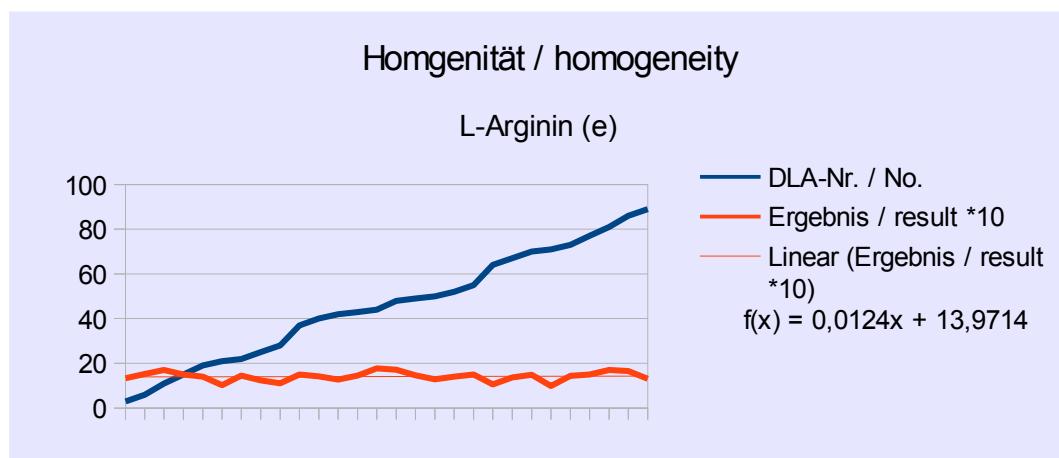

without results with z-Scores > |3,0|

<b>L-Phenylalanine</b>	
Target standard deviation $\sigma_{opt}$	0,114 g/100g
Sample numbers	3 – 89
Total numbers of samples	28
Slope	-0,00109
Trend line range	1,872 – 1,842 g/100g
Deviation trend line	1,857 ± 0,0153 g/100g
<b>Percent of opt</b>	13,4 %

without results with z-Scores > |3,0|

<b>L-Tyrosine</b>	
Target standard deviation $\sigma_{opt}$	0,0862 g/100g
Sample numbers	3 – 89
Total numbers of samples	28
Slope	0,00054
Trend line range	1,176 – 1,191 g/100g
Deviation trend line	1,184 ± 0,00756 g/100g
<b>Percent of opt</b>	8,8 %

without results with z-Scores > |3,0|

**Abb./Fig. 37:**

Trendfunktion Probennummern vs. Ergebnisse: L-Arginin, L-Phenylalanin und L-Tyrosin ( $\times 10$ ,  $\times 20$  und  $\times 10$  dargestellt)  
 trend line function sample number vs. results: L-arginine, L-phenylalanine and L-tyrosine ( $\times 10$ ,  $\times 20$  and  $\times 10$  shown)

### 5.3 Stability

#### 5.3.1 Trend line function of participant results

By comparison of the participant results with the corresponding date of analysis the stability of the PT-material can be characterized for the range of analysis time of the present PT by the trend line functions:

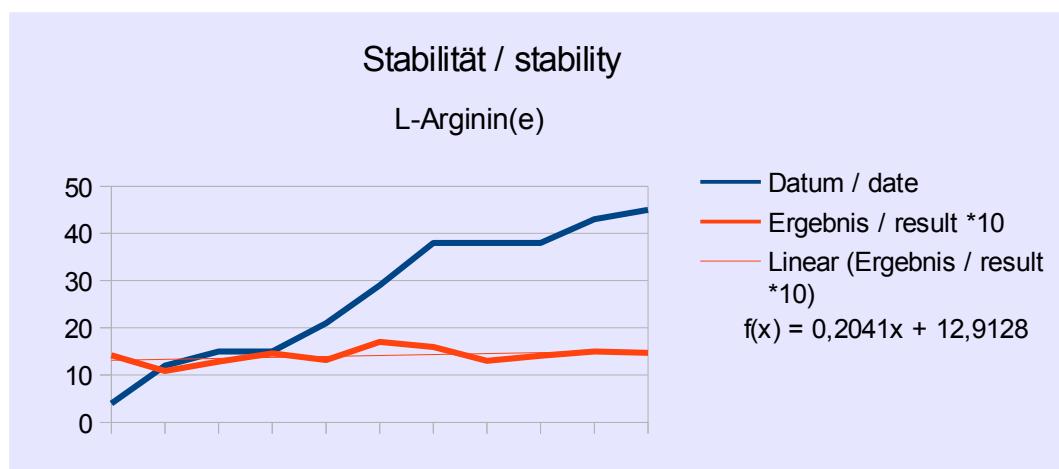

<b>L-Arginine</b>	
Target standard deviation $\sigma_{opt}$	0,193 g/100g
Time of analysis	40 days
Number of results	11
Slope	0,0204
Trend line range	1,291 - 1,516 g/100g
Deviation trend line	1,403 ± 0,1122 g/100g
<b>Percent of <math>\sigma_{opt}</math></b>	<b>58,1 %</b>

<b>L-Phenylalanine</b>	
Target standard deviation $\sigma_{opt}$	0,114 g/100g
Time of analysis	40 days
Number of results	12
Slope	0,00230
Trend line range	1,821 - 1,849 g/100g
Deviation trend line	1,835 ± 0,0138 g/100g
<b>Percent of <math>\sigma_{opt}</math></b>	<b>12,1 %</b>

without results with z-Scores > |3,0|

<b>L-Tyrosine</b>	
Target standard deviation $\sigma_{opt}$	0,0862 g/100g
Time of analysis	40 days
Number of results	11
Slope	-0,00037
Trend line range	1,171 - 1,167 g/100g
Deviation trend line	1,169 ± 0,0020 g/100g
<b>Percent of <math>\sigma_{opt}</math></b>	<b>2,4 %</b>

without results with z-Scores > |3,0|

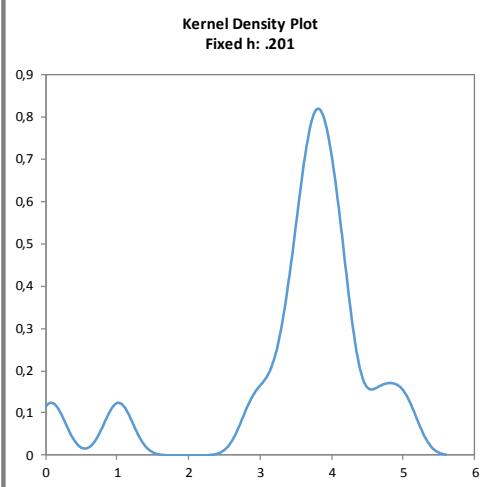

5.4 Kernel Density Plots of Results**Abbildungen:**

L-Valin/L-Valine

L-Tryptophan/L-Tryptophan

**5.5 Information on the Proficiency Test (PT)**

Before the PT the participants received the following information in the sample cover letter:

<b>PT number</b>	<b>DLA 47-2017</b>
<b>PT name</b>	<b>Free Amino Acids in Food</b>
<b>Sample matrix*</b>	<b>Samples A + B:</b> Food supplement capsule powder (without capsule shell) / ingredients: free amino acids (as food additives), maltodextrin and further food additives (bulking agents, separating agents, food dye titanium dioxide); Protein equivalent content is > 20%
<b>Number of samples and sample amount</b>	2 identical samples A + B: 10 g each.
<b>Storage</b>	Samples A + B: cooled 2 - 10°C (dry and dark)
<b>Intentional use</b>	Laboratory use only (quality control samples)
<b>Parameter</b>	quantitative: diverse free amino acids (see result submission file)
<b>Methods of analysis</b>	Analytical methods are optional
<b>Notes to analysis</b>	The analysis of PT samples should be performed like a routine laboratory analysis. In general we recommend to homogenize a representative sample amount before analysis according to good laboratory practice, especially in case of low sample weights.
<b>Result sheet</b>	The results for sample A and B as well as the final results calculated as mean of the double determination (samples A and B) should be filled in the result submission file. The recovery rates, if carried out, has to be included in the calculation.
<b>Units</b>	g/100g
<b>Number of significant digits</b>	at least 2
<b>Further information</b>	For information please specify: <ul style="list-style-type: none"> <li>- Date of analysis</li> <li>- DLA-sample-numbers (for sample A and B)</li> <li>- Limit of detection</li> <li>- Assignment incl. Recovery</li> <li>- Recovery with the same matrix</li> <li>- Method is accredited</li> </ul>
<b>Result submission</b>	The result submission file should be sent by e-mail to: <b>pt@dla-lvu.de</b>
<b>Deadline</b>	<b>the latest 03<sup>rd</sup> November 2017</b>
<b>Evaluation report</b>	The evaluation report is expected to be completed 6 weeks after deadline of result submission and sent as PDF file by e-mail.
<b>Coordinator and contact person of PT</b>	Dr. Matthias Besler

\* Control of mixture homogeneity and qualitative testings are carried out by DLA. Testing of the content, homogeneity and stability of PT parameters is subcontracted by DLA.
