## 1. Introduction

The participation in proficiency testing schemes is an essential element of the quality-management-system of every laboratory testing food and feed, cosmetics and food contact materials. The implementation of proficiency tests enables the participating laboratories to prove their own analytical competence under realistic conditions. At the same time they receive valuable data regarding the verification and/or validation of the particular testing method [1, 5].

The purpose of DLA is to offer proficiency tests for selected parameters in concentrations with practical relevance.

Realisation and evaluation of the present proficiency test follows the technical requirements of DIN EN ISO/IEC 17043 (2010) and DIN ISO 13528:2009 / ISO 13528:2015 [2, 3].

## 2. Realisation

### 2.1 Test material

The test material is a mixture of common in commerce dietetic infant (drink powder, from >2 years of age on) with a protein content of < 20% based on milkprotein from a EU suppliers. The raw materials were sieved by means of a centrifugal mill (mesh 500 µm), mixed and homogenized.

Afterwards the samples were portioned to approximately 10 g into metal-lised PET film bags and chronologically numbered.

The composition (list of ingredients) is given in table 1.

Table 1: Composition of DLA-Samples

**Infant Milk Powder from 2 years on****Drink powder 1:**Ingredients:

Skimmed milk, whey product (demineralized whey, whey protein concentrate), oligosaccharides (galactooligosaccharides, fructo-oligosaccharides), palm oil, lactose, sunflower oil, rapeseed oil, potassium orthophosphate, calcium orthophosphate, fish oil, magnesium citrate, calcium carbonate, emulsifier (soya lecithin), vitamin C, ferrous sulfate, magnesium orthophosphate, vitamin E, vitamin D, vitamin B12, pantothenic acid, folic acid, vitamin A, vitamin B2, biotin, niacin, vitamin B6, vitamin B1, potassium iodide, vitamin K

Nutrients per 100 g: Fat 19 g, carbohydrates 45 g thereof sugar 43 g, fiber 8,2 g, protein 16 g, salt 0,6 g

**Drink powder 2:**Ingredients:

Skimmed milk, lactose, palm oil, vegetable oil (rapeseed oil, sunflower oil), calcium citrate, calcium orthophosphate, emulsifier lecithin (soya), vitamin C, vitamin E, pantothenic acid, niacin, vitamin B1 (thiamine), vitamin A, vitamin B6, vitamin B2, folic acid, vitamin K, biotin, vitamin D, vitamin B12, potassium iodide

Nutrients per 100 g: Fat 16 g, carbohydrates 60 g thereof sugar 55 g, protein 17 g, salt 0,5 g

**Note:** The metrological traceability of temperature, mass and volume during production of the PT samples is ensured by DAkkS calibrated reference materials.

### 2.1.1 Homogeneity

The **mixture homogeneity before bottling** was examined 8-fold by **micro-tracer analysis**. It is a standardized method that is part of the international GMP certification system for feed [14].

Before mixing dye coated iron particles of  $\mu\text{m}$  size are added to the sample and the number of particles is determined after homogenization in taken aliquots. The evaluation of the mixture homogeneity is based on the Poisson distribution using the chi-square test. A probability of  $\geq 5\%$  is equivalent to a good homogeneous mixture and of  $\geq 25\%$  to an excellent mixture [14, 15].

The microtracer analysis of the present PT sample showed a probability of 86%. Additionally particle number results were converted into concentrations, statistically evaluated according to normal distribution and compared to the standard deviation according to Horwitz. For the assessment HorRat values between 0,3 and 1,3 are to be accepted under repeat conditions (measurements within the laboratory) [16, 17]. This gave a HorRat value of 0,8. The results of microtracer analysis are given in the documentation.

The calculation of the **repeatability standard deviation  $S_r$  of the participants** was also used as an indicator of homogeneity. For 14 analytes it is  $< 2,4\%$  (0,9% - 2,3%), for cystine, histidine and methionine in the range of 3,2% - 8,6% and for tryptophan increased with approx. 23%. Therefore with exception of tryptophan the repeatability standard deviations are similar to precision data of the referring standardized methods (e.g. ASU §64, s. 3.6.2) (see Tab. 3) [18-20]. The repeatability standard deviations of the participants' results are given in the tables of statistic data (see 4.1 to 4.19).

Table 2: Repeatability standard deviation  $S_r$  of double determinations of the participants (coefficient of variation  $CV_r$  in %)

Parameter	$CV_r$	Parameter	$CV_r$
L-Alanine	2,31 %	L-Lysine	1,48 %
L-Arginine	1,77 %	L-Methionine	4,03 %
L-Aspartic acid	2,21 %	L-Phenylalanine	2,03 %
L-Cystine	8,56 %	L-Proline	0,91 %
L-Glutamic acid	1,49 %	L-Serine	1,43 %
Glycine	1,95 %	L-Threonine	1,55 %
L-Histidine	3,21 %	L-Tryptophan	22,7 %
L-Isoleucine	1,92 %	L-Tyrosine	2,09 %
L-Leucine	1,42 %	L-Valine	1,78 %

Furthermore, the homogeneity was graphically characterized for information by the **trend line function of participants' results for chronological bottled single samples** for the parameters alanine, aspartic acid and methionine (s. 5.2.1).

In case the criterion for sufficient homogeneity of the test items is not fulfilled the impact on the target standard deviation will be verified. If necessary the evaluation of results will be done considering the standard uncertainty of the assigned value by z'-scores (s. 3.8 and 3.11) [3].

### 2.1.2 Stability

A water activity ( $a_w$ ) of  $< 0,5$  is an important factor to ensure the stability of dry or dried products during storage. Optimum conditions for storage is the  $a_w$  value range of  $0,15 - 0,3$ . In this range the lowest possible degradation rate is to be expected [16].

The experience with various DLA test materials showed good storage stability with respect to the durability of the sample (spoilage) and the content of the PT parameters for comparable food matrices and water activity ( $a_w$  value  $< 0,5$ ).

The  $a_w$  value of the PT samples was approx.  $0,21$  ( $23,2^\circ\text{C}$ ). The stability of the sample material was thus ensured during the investigation period under the specified storage conditions.

### 2.2 Sample shipment and information to the test

Two portions of test material were sent to every participating laboratory in the 37<sup>th</sup> week of 2018. The testing method was optional. The tests should be finished at 26<sup>th</sup> October 2018 the latest.

With the cover letter along with the sample shipment the following information was given to participants:

*The two portions contain identical samples of an infant milk drinking powder for children from 2 years on. Parameters to be determined are amino acids after protein hydrolysis. The protein equivalent content is  $< 20\%$ . The analysis method is optional.*

**Please note the attached information on the proficiency test.**

(see documentation, section 5.4 Information on the PT)

### 2.3 Submission of results

The participants submitted their results in standard forms, which have been handed out with the samples (by email).

The finally calculated concentrations of the parameter as average of duplicate determinations of both numbered samples were used for the statistical evaluation. For the calculation of the repeatability- and reproducibility standard deviation the single values of the double determination were used.

Queried and documented were single results, recovery and the used testing methods. In case participants submitted several results for the same parameter obtained by different methods these results were evaluated with the same evaluation number with a letter as a suffix and indication of the related method.

All 13 participants submitted their results in time.

### 3. Evaluation

#### 3.1 Consensus value from participants (assigned value)

The robust mean of the submitted results was used as assigned value ( $X_{pt}$ ) („consensus value from participants“) providing a normal distribution. The calculation was done according to algorithm A as described in annex C of ISO 13528 [3]. If there are < 12 quantitative results and an increased difference between robust mean and median, the median may be used as the assigned value (criterion:  $\Delta \text{median} - \text{rob. mean} > 0,3 \sigma_{pt}$ ) [3].

The condition is that the majority of the participants' results show a normal distribution or are distributed unimodal and symmetrically. To this end, an examination of the distribution is carried out, inter alia, using the kernel density estimate [3, 12].

In case there are indications for sources of higher variability such as a bimodal distribution of results, a cause analysis is performed. Frequently different analytical methods may cause an anomaly in results' distribution. If this is the case, separate evaluations with own assigned values ( $X_{pt,i}$ ) are made whenever possible.

The statistical evaluation is carried out for all the parameters for a minimum of 7 values are present, in justified cases, an evaluation may also be carried out from 5 results onwards.

The actual measurement results will be drafted. Individual results, which are outside the specified measurement range of the participating laboratory (for example with the result  $> 25 \text{ mg/kg}$  or  $< 2,5 \text{ mg/kg}$ ) or the indicating "0" will not be considered for the statistic evaluation [3].

#### 3.2 Robust standard deviation

For comparison to the target standard deviation  $\sigma_{pt}$  (standard deviation for proficiency assessment) a robust standard deviation ( $S^*$ ) was calculated. The calculation was done according to algorithm A as described in annex C of ISO 13528 [3].

#### 3.3 Repeatability standard deviation

The repeatability standard deviation  $S_r$  is based on the laboratory's standard deviation of (outlier free) individual participant results, each under repeatability conditions, that means analyses was performed on the same sample by the same operator using the same equipment in the same laboratory within a short time. It characterizes the mean deviation of the results within the laboratories [3] and is used by DLA as an indication of the homogeneity of the sample material.

In case single results from participants are available the calculation of the repeatability standard deviation  $S_r$ , also known as standard deviation within laboratories  $S_w$ , is performed by: [3, 4].

The relative repeatability standard deviation as a percentage of the mean value is indicated as coefficient of variation  $CV_r$  in the table of stat-

istical characteristics in the results section in case single results from participants are available.

### 3.4 Reproducibility standard deviation

The reproducibility standard deviation  $S_R$  represents a inter-laboratory estimate of the standard deviation for the determination of each parameter on the bases of (outlier free) individual participant results. It takes into account both the repeatability standard deviation  $S_r$  and the within-laboratory standard deviation  $S_s$ . Reproducibility standard deviations of PT's may differ from reproducibility standard deviations of ring trials, because the participating laboratories of a PT generally use different internal conditions and methods for determining the measured values.

In the present evaluation, the specification of the reproducibility standard deviation, therefore, does not refer to a specific method, but characterizes approximately the comparability of results between the laboratories, assumed the effect of homogeneity and stability of the sample are negligible.

In case single results from participants are available the calculation of the reproducibility standard deviation  $S_R$  is performed by: [3, 4].

The relative reproducibility standard deviation  $CV_R$  in percent of the mean is given as variation coefficient in the statistical data of participant for each parameter. The significance of  $CV_R$  is further explained in section 3.9.

### 3.5 Exclusion of results and outliers

Before statistical evaluation obvious blunders, such as those with incorrect units, decimal point errors, too few significant digits (valid digits) or results for another proficiency test item can be removed from the data set [2]. Even if a result e.g. with a factor >10 deviates significantly from the mean and has an influence on the robust statistics, a result of the statistical evaluation can be excluded [3].

All results should be given at least with 2 significant digits. Specifying 3 significant digits is usually sufficient.

Results obtained by different analytical methods causing an increased variability and/or a bi- or multimodal distribution of results, are treated separately or could be excluded in case of too few numbers of results. For this results are checked by kernel density estimation [3, 12].

Results are tested for outliers by the use of robust statistics (algorithm A): If a value deviates from the robust mean by more than 3 times the robust standard deviation, it can be classified as an outlier (see above) [3]. Due to the use of robust statistics outliers are not excluded, provided that no other reasons are present [3]. Detected outliers are only mentioned in the results section, if they have been excluded from the statistical evaluation.

### 3.6 Target standard deviation (for proficiency assessment)

The target standard deviation of the assigned value  $\sigma_{pt}$  (= standard deviation for proficiency assessment) can be determined according to the following methods.

If an acceptable quotient  $S^*/\sigma_{pt}$  is present, the target standard deviation of the general model by Horwitz is preferably used for the proficiency assessment. It is usually suitable for evaluation of interlaboratory studies, where different methods are applied by the participants. On the other hand the target standard deviation from the evaluation of precision data of an precision experiment is derived from collaborative studies with specified analytical methods.

In cases where both above-mentioned models are not suitable, the target standard deviation is determined based on values by perception, see under 3.6.3.

For information, the z-scores of both models are given in the evaluation, if available.

***In the present PT for valuation of all following parameters the target standard deviation according to the general model of Horwitz was applied (see 3.6.1): Glycine and L-Phenylalanine.***

***For the valuation of the following parameters the target standard deviation from precision experiments (s. 3.6.2) (German official ASU §64 [18, 19]) was applied: L-Alanine, L-Arginine, L-Aspartic Acid, L-Cystine, L-Glutamic Acid, L-Histidine, L-Isoleucine, L-Leucine, L-Lysine, L-Methionine, L-Proline, L-Serine, L-Threonine, L-Tryptophan, L-Tyrosine and L-Valine.***

***Additionally for L-Tryptophan the standard uncertainty was considered by evaluation using z'-scores (see 3.6.8).***

***Due to the low number of < 7 the results of Cysteine were not evaluated by means of z-scores.***

### 3.6.1 General model (Horwitz)

Based on statistical characteristics obtained in numerous PTs for different parameters and methods Horwitz has derived a general model for estimating the reproducibility standard deviation  $\sigma_R$  [6]. Later the model was modified by Thompson for certain concentration ranges [10]. The reproducibility standard deviation  $\sigma_R$  can be applied as the relative target standard deviation  $\sigma_{pt}$  in % of the assigned values and calculated according to the following equations [3]. For this the assigned value  $X_{pt}$  is used for the concentration  $c$ .

Equations	Range of concentrations	corresponds to
$\sigma_R = 0,22c$	$c < 1,2 \times 10^{-7}$	$< 120 \mu\text{g}/\text{kg}$
$\sigma_R = 0,02c^{0,8495}$	$1,2 \times 10^{-7} \leq c \leq 0,138$	$\geq 120 \mu\text{g}/\text{kg}$
$\sigma_R = 0,01c^{0,5}$	$c > 0,138$	$> 13,8 \text{ g}/100\text{g}$

with  $c$  = mass content of analyte (as relative size, e.g. 1 mg/kg = 1 ppm =  $10^{-6}$  kg/kg)

### 3.6.2 Value by precision experiment

Using the reproducibility standard deviation  $\sigma_R$  and the repeatability standard deviation  $\sigma_r$  of a precision experiment (collaborative trial or proficiency test) the target standard deviation  $\sigma_{pt}$  can be derived considering the number of replicate measurements  $m$  of participants in the present PT [3]:

$$\sigma_{pt} = \sqrt{\sigma_R^2 - \sigma_r^2 (m-1/m)}$$

The values given in Table 3 relative repeatability standard deviation ( $RSD_r$ ) and relative reproducibility standard deviation ( $RSD_R$ ) were determined in collaborative trials using the specified methods. The in the table indicated resulting target standard deviation  $\sigma_{pt}$  is additionally given in the evaluation for information.

**Table 3:** Relative repeatability standard deviations ( $RSD_r$ ) and relative reproducibility standard deviations ( $RSD_R$ ) from precision experiments and resulting target standard deviations  $\sigma_{pt}$  [18-20]

Parameter	Matrix	Mean [g/100g]	$RSD_r$	$RSD_R$	$\sigma_{pt}$	Method / Literature

<sup>1</sup> used/given in evaluation (s. chapter 4)

### 3.6.3 Value by perception

The target standard deviation for proficiency assessment can be set at a value that corresponds to the level of performance that the coordinator would wish laboratories to be able to achieve [3].

For the present evaluation the target standard deviation according to 3.6.1 or 3.6.2 was regarded suitable.

Table 4 shows selected statistic data of participants results of present PT compared to PT results of previous years.

### 3.7 z-Score

To assess the results of the participants the z-score is used. It indicates about which multiple of the target standard deviation ( $\sigma_{pt}$ ) the result ( $x_i$ ) of the participant is deviating from the assigned value ( $X_{pt}$ ) [3].

Participants' z-scores are derived from:

$$z_i = \frac{(x_i - X_{pt})}{\sigma_{pt}}$$

The requirements for the analytical performance are generally considered as fulfilled if

$$-2 \leq z \leq 2 .$$

The valid z-Score for each parameter is indicated as z-Score ( $\sigma_{pt}$ ). The value indicated as z-Score (Info) only obtains an informative character. The both z-Scores were calculated with the different target standard deviations in accordance with 3.6.

#### 3.7.1 Warning and action signals

In accordance with the norm ISO 13528 it is recommended that a result that gives rise to a z-score above 3,0 or below -3,0, shall be considered to give an "action signal" [3]. Likewise, a z-score above 2,0 or below -2,0 shall be considered to give a "warning signal". A single "action signal", or "warning signal" in two successive PT-rounds, shall be taken as evidence that an anomaly has occurred which requires investigation. For example a fault isolation or a root cause analysis through the examination of transmission error or an error in the calculation, in the trueness and precision must be performed and if necessary appropriate corrective measures should be applied [3].

In the figures of z-scores DLA gives the limits of warning and action signals as yellow and red lines respectively. According to ISO 13528 the signals are valid only in case of a number of  $\geq 10$  results [3].

**Table 4:** Characteristics of the present PT (on dark grey) in comparison to previous PTs since 2015 (SD = standard deviation, CV = coefficient of variation)

Parameter	Matrix (Powder)	robust Mean [g/100g]	rob. SD (S*) [g/100g]	rel. SD (CV <sub>S*</sub> ) [%]	Quotient S*/σ <sub>PT</sub>	DLA-Report

### 3.8 z'-Score

The z'-score can be used for the valuation of the results of the participants, in cases the standard uncertainty has to be considered (s. 3.8). The z'-score represents the relation of the deviation of the result (x) of the participant from the respective consensus value (X) to the square root of quadrat sum of the target standard deviation ( $\sigma_{pt}$ ) and the standard uncertainty ( $U_{x_{pt}}$ ) [3].

The calculation is performed by:

$$z'_i = \frac{x_i - x_{pt}}{\sqrt{\sigma_{pt}^2 + u_{(x_{pt})}^2}}$$

If carried out an evaluation of the results by means of z 'score, we have defined below the expression in the denominator as a target standard deviation  $\sigma_{pt}'$ .

The requirements for the analytical performance are generally considered as fulfilled if

$$-2 \leq z' \leq 2 .$$

For warning and action signals see 3.7.1.

### 3.9 Reproducibility coefficient of variation (CV<sub>R</sub>)

The variation coefficient (CV) of the reproducibility (= *relative reproducibility standard deviation*) is calculated from the standard deviation and the mean as follows [4, 13]:

$$CV_R = \frac{S_R * 100}{X}$$

In contrast to the standard deviation as a measure of the absolute variability the CV gives the relative variability within a data region. While a low CV, e.g. <5-10% can be taken as evidence for a homogeneous set of results, a CV of more than 50% indicates a "strong inhomogeneity of statistical mass", so that the suitability for certain applications such as the assessment of exceeded maximum levels or the performance evaluation of the participating laboratories possibly can not be done [3].

### 3.10 Quotient $S^*/\sigma_{pt}$

Following the HorRat-value the results of a proficiency-test (PT) can be considered convincing, if the quotient of robust standard deviation  $S^*$  and target standard deviation  $\sigma_{pt}$  does not exceed the value of 2.

A value  $> 2$  means an insufficient precision, i.e. the analytical method is too variable, or the variation between the test participants is higher than estimated. Thus the comparability of the results is not given [3].

### 3.11 Standard uncertainty of the assigned value

Every assigned value has a standard uncertainty that depends on the analytical method, differences between the analytical methods used, the test material, the number of participating laboratories (P) and on other factors. The standard uncertainty ( $U_{(x_{pt})}$ ) for this PT is calculated as follows [3]:

$$u_{(x_{pt})} = 1,25 \times \frac{s^*}{\sqrt{p}}$$

If  $U_{(x_{pt})} \leq 0,3 \sigma_{pt}$  the standard uncertainty of the assigned value needs not to be included in the interpretation of the results of the PT [3]. Values exceeding 0,3 imply, that the target standard deviation could be too low with respect to the standard uncertainty of the assigned value.

The traceability of the assigned value is ensured on the basis of the consensus value as a robust mean of the participant results.

## 4. Results

### Comments to the distribution of the results:

The kernel density plots showed for all parameters nearly a symmetrical distribution of results (figures see documentation 5.3). Partly slight shoulders and separated smaller peaks can be seen, which are due to individual results, outliers or values outside the target range. In the case of tryptophan a distribution of results with two peaks can be seen. However, the information provided by the participants on the methods gave no obvious indications of such an array of results. When using the robust standard deviation as an estimator  $h$ , the distributions are converted into single peak distributions, so that an statistical evaluation has been carried out.

### Comments to the statistic data:

For cysteine there were  $< 7$  results, therefore no statistical evaluation could be done.

The target standard deviation was calculated for all other elements according to the model of Horwitz or according to the data of a precision experiment (ASU §64 method). The evaluation according to Horwitz was preferably used as long as the quotients  $S^*/\sigma_{pt}$  were in the range of  $\leq 2,0$ . In all other cases, the standard deviation calculated from ASU §64 precision data was used (see 3.6).

For all parameters except tryptophan the distribution of results showed a normal variability. The quotients  $S^*/\sigma_{pt}$  were all below 2,0 in the range of 0,60 to 1,9 (see table 4).

For tryptophan the distribution of results showed an increased variability with a quotient above 2,0. Therefore tryptophan was evaluated considering the standard uncertainty by  $z'$ -scores. The quotient  $S^*/\sigma_{pt}'$  was 2,0 then (see table 4).

The robust standard deviation and the repeatability and reproducibility standard deviations were in the expected range of usual values for the used determination methods (s. 3.6.2).

The comparability of results is given.

60% to 100% of results were in the respective target range.

All following tables are anonymized. With the delivering of the evaluation report the participants are informed about their individual evaluation number.

In the first table the characteristics are listed:

<b>Statistic Data</b>
<i>Number of results</i>
<i>Number of outliers</i>
Mean
Median
Robust mean ( $X_{pt}$ )
Robust standard deviation ( $S^*$ )
<i>Number with m replicate measurements</i>
Repeatability standard deviation ( $S_r$ )
Coefficient of Variation ( $CV_r$ ) in %
Reproducibility standard deviation ( $S_R$ )
Coefficient of Variation ( $CV_R$ ) in %
<i>Target range:</i>
Target standard deviation $\sigma_{pt}$ or $\sigma_{pt}'$
Target standard deviation for information
lower limit of target range ( $X_{pt} - 2\sigma_{pt}$ ) or ( $X_{pt} - 2\sigma_{pt}'$ ) *
upper limit of target range ( $X_{pt} + 2\sigma_{pt}$ ) or ( $X_{pt} + 2\sigma_{pt}'$ ) *
<i>Quotient <math>S^*/\sigma_{pt}</math> or <math>S^*/\sigma_{pt}'</math></i>
<i>Standard uncertainty <math>U(X_{pt})</math></i>
<i>Number of results in the target range</i>
<i>Percent in the target range</i>

\* Target range is calculated with z-score or z'-score

In the table below, the results of the participating laboratories are formatted in 3 valid digits\*\*:

<b>Auswerte- nummer</b>	<b>Parameter [Einheit / Unit]</b>	<b>Abweichung</b>	<b>z-Score <math>\sigma_{pt}</math></b>	<b>z-Score (Info)</b>	<b>Hinweis</b>
<b>Evaluation number</b>		<b>Deviation</b>			<b>Remark</b>

\*\* In the documentation part, the results are given as they were transmitted by the participants.

**5.1.2 Analytical Methods**

\* For application of the same method notes to the method could be given for L-Alanine only.

Parameter	Participant	Method specification, as in test report / standard / literature *	Notes to sample preparation*	Notes to analytical method*	Calibration and reference material	Recovery with same matrix yes / no	Method accr. ISO / IEC 17025 yes / no	Further remarks	
L-Alanine	1	Total amino acids after acid hydrolysis by amino acid analyzer (with post coulumn derivatization)	acid hydrolysis with 6 M HCl, 24 h at 110°C	amino acid analyzer (with post coulumn derivatization, ninhydrin)	External standard, one point calibration, reference material: milk protein		yes		
	2	ASU § 64	Hydrolysis	amino acid analyzer	yes		yes		
	3	Phenomenex EZ faast GC FID	16 h at 110°C with 6 mol HCl	GC FID			no		
	4	SOP M 3123	sample weight in, digestion with microwave, dilution, derivatization, measurement				yes		
	5	§64 LFGB L 49.07-2	Hydrolysis with 6 N HCL	Derivatization with Ninhydrin	DLA 59 / 2016	no	yes		
	6	Determination by amino acid analyzer after acid hydrolysis			internal standard		yes		
	7	VO(EG) 152/2009, III, F : 2009-02	na	na	na	no	yes		
	8	acid hydrolysis followed by HPLC with fluorescence detection						accredited for total amino acids but not for free amino acids	
	9	Waters - ACCQ.TAG Chemistry Package – Instruction Manual, WAT 052 874 TP, rev. 0 April, 1993 *				Thermo Scientific Amino Acids Standard H		yes	
	10	HPLC-FLD	acid hydrolysis, OPA-deriv.	HPLC-FLD; ISTD	PT 2014	no	yes		
	11	AOAC (2000) 999.13 Ch4 p17	Alkali Hydrolysis	Internal Method QC0601	single point	no	yes		
	12	Total amino acids (according Regulation(EC) Nr. 152/2009)	Hydrolysis		internal std, 1-point calibration, feed		yes		
	13	HPLC/UV-FLD - internal method PNTQ1339			external calib. curve and internal RM	no	no		

Parameter	Participant	Method specification, as in test report / standard / literature *	Notes to sample preparation*	Notes to analytical method*	Calibration and reference material	Recovery with same matrix yes / no	Method accr. ISO / IEC 17025 yes / no	Further remarks

## 5.2 Homogeneity

### 5.2.1 Mixture homogeneity before bottling

#### Microtracer Homogeneity Test

##### DLA 50-2018

Weight whole sample	0,97	kg
Microtracer	FSS-rot lake	
Particle size	75 – 300	µm
Weight per particle	2,0	µg
Addition of tracer	33,9	mg/kg

#### Result of analysis

Sample	Weight [g]	Particle number	Particles [mg/kg]
1	5,00	98	39,2
2	5,03	101	40,2
3	5,03	92	36,6
4	5,02	86	34,3
5	5,05	99	39,2
6	5,02	97	38,6
7	5,00	90	36,0
8	5,00	82	32,8

#### Poisson distribution

Number of samples	8	
Degree of freedom	7	
Mean	93,1	Particles
Standard deviation	6,61	Particles
$\chi^2$ (CHI-Quadrat)	3,29	
<b>Probability</b>	<b>86</b>	<b>%</b>
Recovery rate	109	%

#### Normal distribution

Number of samples	8	
Mean	37,1	mg/kg
Standard deviation	2,64	mg/kg
rel. Standard deviation	7,10	%
Horwitz standard deviation	9,29	%
<b>HorRat-value</b>	<b>0,76</b>	
Recovery rate	109	%

**5.2.2 Comparison of sample numbers / test results and trend line**

By comparison of the increasing sample numbers and the measurement results of participants, the homogeneity of the chronological bottled PT items can be shown by the trend line for information:

**Abb./Fig. 38:** Trendfunktion Probennummern vs. Ergebnisse: L-Alanin, L-Asparaginsäure und L-Methionin (1\*100, 1\*50 und 1\*100 dargestellt) trend line function sample number vs. results: L-Alanine, L-Aspartic acid and L-Methionine (1\*100, 1\*50 and 1\*100 shown)

5.3 Kernel Density Plots of Results

**Abbildungen:**

Kerndichte-Schätzungen der Teilnehmerergebnisse (mit  $h = 0,75 \times \sigma_{pt}$  von  $X_{pt}$ )

**Figures:**

Kernel density plots of participants' results (with  $h = 0,75 \times \sigma_{pt}$  of  $X_{pt}$ )

L-Alanin / L-Alanine

L-Arginin / L-Arginine

L-Asparaginsäure / L-Aspartic acid

L-Cystein / L-Cysteine

<8 Ergebnisse  
<8 Results

L-Cystin / L-Cystine

**Abbildungen:**

Kerndichte-Schätzungen der Teilnehmerergebnisse (mit  $h = 0,75 \times \sigma_{pt}$  von  $X_{pt}$ )

**Figures:**

Kernel density plots of participants' results (with  $h = 0,75 \times \sigma_{pt}$  of  $X_{pt}$ )

L-Glutaminsäure / L-Glutamic acid

Glycin / Glycine

L-Histidin / L-Histidine

L-Isoleucin / L-Isoleucine

L-Leucin / L-Leucine

**Abbildungen:**

Kerndichte-Schätzungen der Teilnehmerergebnisse (mit  $h = 0,75 \times \sigma_{pt}$  von  $X_{pt}$ )

**Figures:**

Kernel density plots of participants' results (with  $h = 0,75 \times \sigma_{pt}$  of  $X_{pt}$ )

L-Lysin / L-Lysine

L-Methionin / L-Methionine

L-Phenylalanin / L-Phenylalanine

L-Prolin / L-Proline

L-Serin / L-Serine

**Abbildungen:**

Kerndichte-Schätzungen der Teilnehmerergebnisse (mit  $h = 0,75 \times \sigma_{pt}$  von  $X_{pt}$ )

**Figures:**

Kernel density plots of participants' results (with  $h = 0,75 \times \sigma_{pt}$  of  $X_{pt}$ )

L-Threonin / L-Threonine

L-Tryptophan / L-Tryptophan

L-Tyrosin / L-Tyrosine

L-Valin / L-Valine

**5.4 Information on the Proficiency Test (PT)**

Before the PT the participants received the following information in the sample cover letter:

<i>PT number</i>	<b>DLA 50-2018</b>
<i>PT name</i>	<b>Total Amino Acids in Food</b>
<i>Sample matrix*</i>	<b>Samples I + II: infant food, drink powder with a protein content &lt;20% from milk protein, ingredients: skimmed milk powder, whey products, oligosaccharides, fats, lactose, minerals and vitamins</b>
<i>Number of samples and sample amount</i>	2 identical samples I + II, 10 g each.
<i>Storage</i>	Samples I + II: room temperature (dry and dark)
<i>Intentional use</i>	Laboratory use only (quality control samples)
<i>Parameter</i>	quantitative: <b>diverse amino acids after protein hydrolysis</b> (see result submission file)
<i>Methods of analysis</i>	Analytical methods are optional
<i>Notes to analysis</i>	The analysis of PT samples should be performed like a routine laboratory analysis. In general we recommend to homogenize a representative sample amount before analysis according to good laboratory practice, especially in case of low sample weights.
<i>Result sheet</i>	The results for sample I and II as well as the final results calculated as mean of the double determination (samples I and II) should be filled in the result submission file. The recovery rates, if carried out, has to be included in the calculation.
<i>Units</i>	g/100g
<i>Number of significant digits</i>	at least 2
<i>Further information</i>	For information please specify: <ul style="list-style-type: none"> <li>- Date of analysis</li> <li>- DLA-sample-numbers (for sample I and II)</li> <li>- Limit of detection</li> <li>- Assignment incl. Recovery</li> <li>- Recovery with the same matrix</li> <li>- Method is accredited</li> </ul>
<i>Result submission</i>	The result submission file should be sent by e-mail to: <b>pt@dla-lvu.de</b>
<i>Deadline</i>	<b>the latest 26<sup>th</sup> October 2018</b>
<i>Evaluation report</i>	The evaluation report is expected to be completed 6 weeks after deadline of result submission and sent as PDF file by e-mail.
<i>Coordinator and contact person of PT</i>	Matthias Besler-Scharf, PhD

\* Control of mixture homogeneity and qualitative testings are carried out by DLA. Testing of the content, homogeneity and stability of PT parameters is subcontracted by DLA.
